Last Revised 6/24/19

NOTE: Read installation instructions thoroughly before starting installation process.

Step 1: Lay out area and prepare site for install. Concrete must be installed over a solid, level base. Check local soil condition and codes. See installation instructions for minimum use zone requirements to ensure proper spacing and adequate surfacing area. Excavate appropriate footer size for your installation.

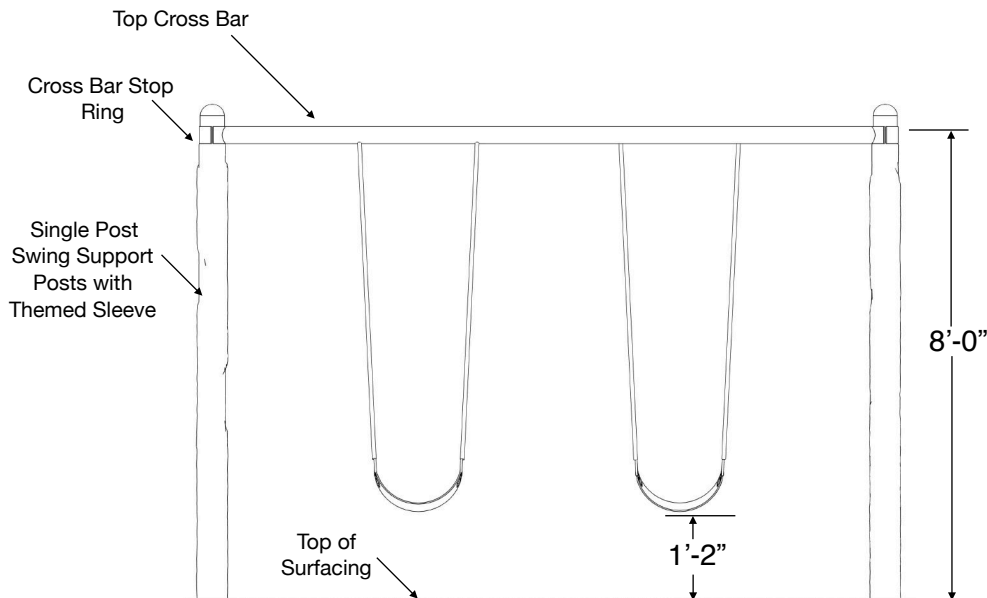

Step 2: Refer to typical 18" footing detail in these installation instructions.

Step 3: Place the Single Post Swing support posts in a horizontal position. Slide the themed post sleeve over the support post within 1" of the cross bar stop ring. Using clear silicone adhesive/caulk, put a 1/4" bead all the way around the support post against the themed post sleeve. Slide the themed post sleeve up 1" over the silicone so the themed post sleeve is touching the cross bar stop ring. Install the U-bolt on the support post at the base of the themed sleeve (this will hold the themed sleeve in place while setting the post assembly).

Step 4: Assemble top rail and support posts. Lift the assembly into excavated footings, bracing when level and plumb. Pour concrete footings for the swing. This concrete should be flush with the ground level. Allow time for the concrete to completely cure before continuing.

Step 5: Remove temporary bracing. Once the posts are set, seal the top of the themed sleeve to the support post with silicone caulk/adhesive.

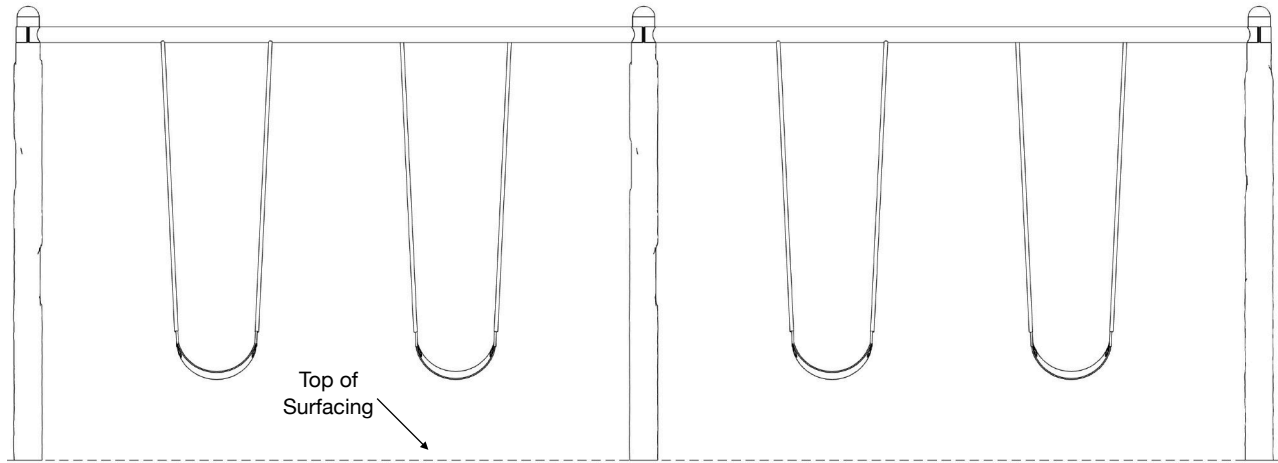

Step 6: Assemble belt and/or bucket seats, chains, and clamps, then install onto top rail per manufacturer's instructions. Refer to the surfacing manufacturer for installation of an approved impact attenuating play surface around the swings, the minimum shown on the Single Post Swing installation instructions.
